

Configuration examples for the D-Link NetDefend Firewall series

DFL-210/800/1600/2500

Scenario: How to configure L2TP and PPTP
servers for remote users with PPPoE v1.01

Last update: 2008-01-30

Overview

In this document, the notation *Objects->Address book* means that in the tree on the left side of the screen **Objects** first should be clicked (expanded) and then **Address Book**.

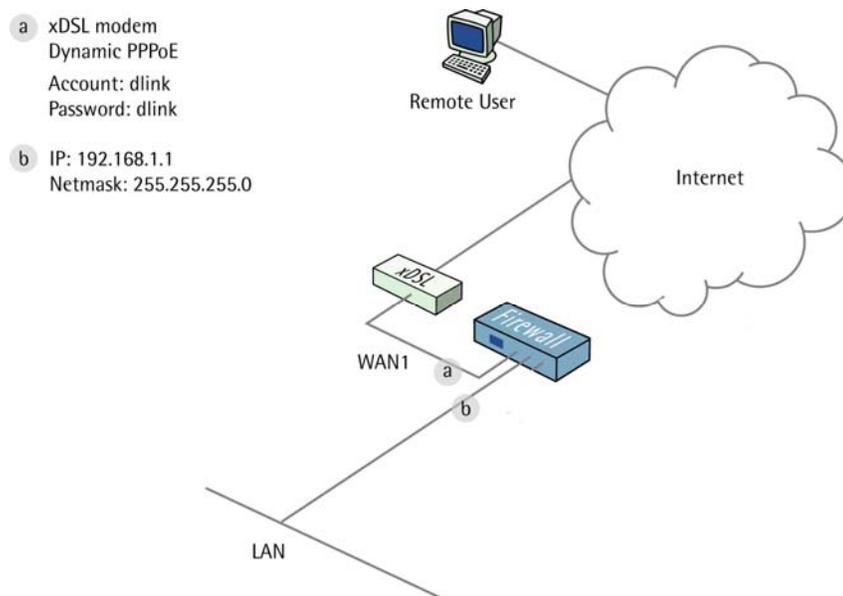

Most of the examples in this document are adapted for the DFL-800. The same settings can easily be used for all other models in the series. The only difference is the names of the interfaces. Since the DFL-1600 and DFL-2500 has more than one lan interface, the lan interfaces are named lan1, lan2 and lan3 not just lan.

The screenshots in this document is from firmware version 2.11.02. If you are using an earlier version of the firmware, the screenshots may not be identical to what you see on your browser.

To prevent existing settings to interfere with the settings in these guides, reset the firewall to factory defaults before starting.

How to configure L2TP and PPTP servers for remote users when firewall is using PPPOE

In this scenario the firewall is connected to ISP. The connection to the first ISP is using a **PPPoE client** on the WAN1 interface provides a **PPTP server** for remote user on the WAN1 interface. The PPTP server uses MPPE encryption.

1. Addresses

Go to *Objects* -> *Address book* -> *InterfaceAddresses*.

Edit the following items:

Change **lan_ip** to **192.168.1.1**

Change **lanet** to **192.168.1.0/24**

Go to *Objects* -> *Address book*.

Add a new Address Folder called **IPPool1s**.

In the new folder, add a new IP4 Host/Network:

Name: **pptp-ippool**

IP Address: **192.168.1.10-192.168.1.19**

Click Ok

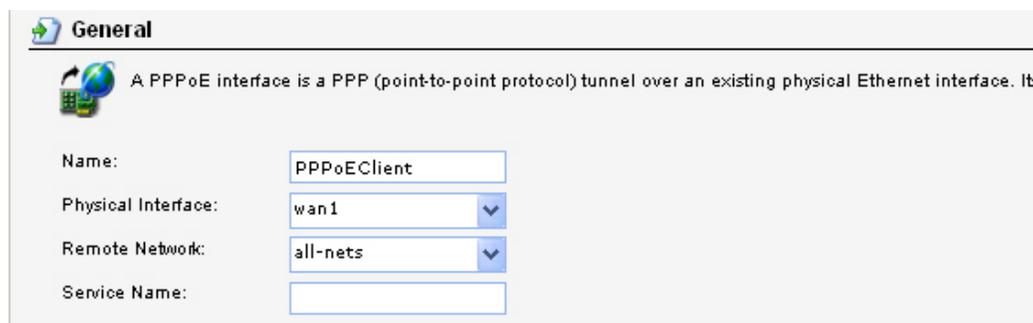

2. PPPoE client

Go to *Interfaces* -> *PPPoE Tunnels*.

Add a new PPPoE Tunnel.

In the General tab:

General:

A screenshot of the Mikrotik WinBox 'General' tab for a PPPoE client configuration. The tab title is 'General'. Below the title is a globe icon and a description: 'A PPPoE interface is a PPP (point-to-point protocol) tunnel over an existing physical Ethernet interface. Its'. Below this are four fields: 'Name:' with the value 'PPPoEClient', 'Physical Interface:' with a dropdown menu showing 'wan1', 'Remote Network:' with a dropdown menu showing 'all-nets', and 'Service Name:' with an empty text box.

Name:	PPPoEClient
Physical Interface:	wan1
Remote Network:	all-nets
Service Name:	

Name: **PPPoEClient**

Physical Interface: **wan1**

Remote Network: **all-nets**

Authentication:

Username:	<input type="text" value="dlink"/>
Password:	<input type="password" value="*****"/>
Confirm Password:	<input type="password" value="*****"/>

Username: **dlink** (For Example)

Password: **dlink**

Confirm Password: **dlink**

Click Ok.

3. PPTP Server

Go to *Interfaces* -> *L2TP/PPTP Servers*.

Add a new L2TP/PPTP Server:

In the General tab:

Name:	<input type="text" value="PPTPServer"/>
Inner IP Address:	<input type="text" value="lan_ip"/>
Tunnel Protocol:	<input type="text" value="PPTP"/>
Outer Interface Filter:	<input type="text" value="any"/>
Server IP:	<input type="text" value="ip_PPPEClient"/>

General:

Name: **PPTPServer**

Inner IP Address: **lan_ip**

Tunnel Protocol: **PPTP**

Outer Interface Filter: **any**

Server IP: **ip_PPPEClient** (This is the IP that remote users will connect to, in this case the IP the firewall is assigned to by the PPPoE service)

In the PPP Parameters tab:

IP Pool:

IP Pool: **pptp_ippool**

In the Add Route tab:

Allowed Networks: **all-nets**

Click Ok.

Microsoft Point-to-Point Encryption (MPPE):

In this example we will use the default settings. If higher security is wanted, disable all MPPE options except RC4 128 bit (which gives best security).

4. User database

Go to *User Authentication -> Local User Databases*.

Add a new Local Userdatabase called RemoteUsers.

In the new database, add a new User:

General:

Name: **User**

Password: **User**

Confirm Password: **User**

*Note: Passwords should be chosen wisely so that they cannot be guessed or easily hacked.

5. User Authentication Rules

Go to *User Authentication -> User Authentication Rules*.

Add a new User Authentication Rule:

In the General tab:

General

The User Authentication Ruleset specifies from where users are allowed to authenticate to the system, and I

 Name:

Agent: ▼

Authentication Source: ▼

Interface: ▼

Originator IP: ▼  For XAuth and PPP, this is the tunnel originator IP.

Terminator IP: ▼

General:

Name: **PPTPUARule**

Agent: **PPP**

Authentication Source: **Local**

Interface: **PPTPServer**

Originator IP: **all-nets**

Terminator IP: **ip_PPPOEClient**

In the Authentication Options tab.

General:

Local User DB: **RemoteUsers**

Click Ok.

Per-user PPTP/L2TP IP Configuration:

Static Client IP Address could be used to give the remote user an own IP. In this example we will use an IP pool to assign IP addresses to the users.

Click Ok.

6. Dynamic DNS

Go to System -> *Misc. Clients*.

Add a new DynDNSClientDynDNS.Org:

In the General tab:

DNSName:	<input type="text" value="dlinktest.dyndns.org"/>	eg: test.dyndns.org
Username:	<input type="text" value="dlink"/>	
Password:	<input type="password" value="*****"/>	
Confirm Password:	<input type="password" value="*****"/>	

DNSName: dlinktest.dyndns.org

Username: dlink

Password: dlink

Confirm Password: dlink

Click Ok.

Go to System ->DNS

Primary Server: pppoe_dns1

Primary Server:	<input type="text" value="pppoe_dns1"/>	▼
Secondary Server:	<input type="text" value="(None)"/>	▼
Tertiary Server:	<input type="text" value="(None)"/>	▼

Click Ok.

7. Rules

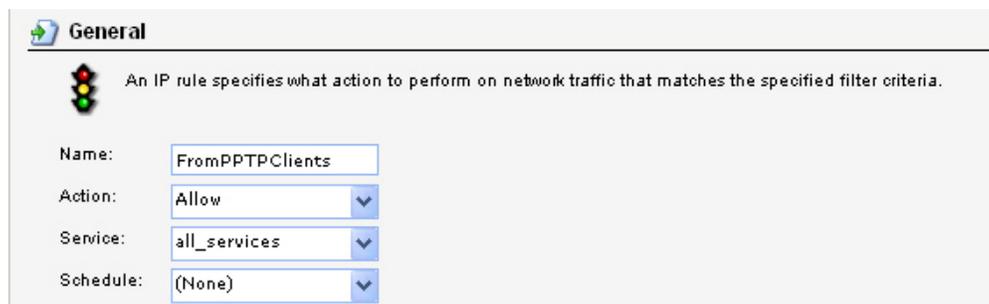

Go to *Rules* -> *IP Rules*:

Add a new IP Rule Folder called **RemoteSites**.

In the new folder, add a new IP Rule:

In the General Tab:

General:

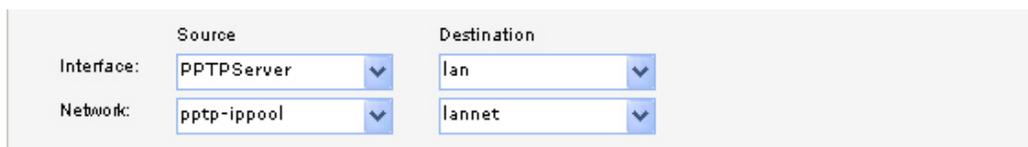

The screenshot shows the 'General' tab of an IP rule configuration window. At the top, there is a traffic light icon and a description: 'An IP rule specifies what action to perform on network traffic that matches the specified filter criteria.' Below this, there are four fields: 'Name' with the value 'FromPPTPClients', 'Action' with a dropdown menu set to 'Allow', 'Service' with a dropdown menu set to 'all_services', and 'Schedule' with a dropdown menu set to '(None)'.

Name: **FromPPTPClients**

Action: **Allow**

Service: **all_services**

Address Filter:

The screenshot shows the 'Address Filter' tab of the IP rule configuration window. It contains two rows of fields. The first row is for the 'Interface' and 'Destination' fields, with 'PPTPServer' selected for the source interface and 'lan' selected for the destination interface. The second row is for the 'Network' and 'Destination' fields, with 'pptp-ippool' selected for the source network and 'lannet' selected for the destination network.

Source interface: **PPTPServer**

Source network: **pptp-ippool**

Destination interface: **lan**

Destination network: **lannet**

Click Ok.

Save and activate the configuration.
